

THE CLEANEST PATH FROM THE SPD TO THE OR

**Instrument Contamination/Tearing is a Thing
of the Past with the NoTouch™ System**

THIS

NOT THIS!

Built-in handles... To maintain sterility!

The NoTouch™ system eliminates virtually all human interaction during instrument reprocessing. Thanks to our stainless steel shelves and baskets that can be placed directly into the autoclave, over-handling and possible tears that result in contamination during sterilization or transport is a thing of the past. With No Touch, the shelf is handled, not the pack... until it is needed in the OR.

- The system shelves and baskets are built with handles so that there is zero handling of blue wrapped packs, maintaining 100% sterility during transport from the Sterile Processing Dept.
- Stainless steel construction is designed to resist contamination
- High density, flexible storage allows for greater capacity without stacking, protecting wrapped packs from tearing.
